FURTHER INFORMATION

The Transportation Tomorrow Survey (TTS) is part of an ongoing data collection program by the Transportation Information Steering Committee (TISC). The survey data (2022, 2016, 2011, 2006, 2001, 1996, 1991 and 1986) are currently under the care of the Data Management Group (DMG). This group is responsible for maintaining the TTS databases and making available appropriate travel information for any urban transportation study in the area. Requests for information from the TTS, or enquiries related to the contents of this report, should be directed to the address below.

ACKNOWLEDGMENTS

The Transportation Tomorrow Survey (TTS) was funded by 25 agencies:

- City of Barrie
- City of Brantford
- City of Guelph
- City of Hamilton
- City of Peterborough
- City of Toronto
- City of Orillia
- County of Brant
- County of Dufferin
- County of Grey
- County of Northumberland
- County of Peterborough
- County of Simcoe
- County of Wellington
- Metrolinx
- Ontario Ministry of Transportation
- Regional Municipality of Durham
- Regional Municipality of Halton
- Regional Municipality of Niagara
- Regional Municipality of Peel
- Regional Municipality of Waterloo
- Regional Municipality of York
- Toronto Transit Commission (TTC)
- Town of Orangeville
- Town of the Blue Mountains

Transportation Information Steering Committee (TISC) participated in planning and directing the 2022 TTS. The committee also has conducted the previous TTS studies since 1986. The agencies with representatives on the TISC steering committee were:

- City of Hamilton
- City of Toronto
- Metrolinx
- Ontario Ministry of Transportation
- Regional Municipality of Durham

- Regional Municipality of Halton
- Regional Municipality of Peel
- Regional Municipality of York
- Toronto Transit Commission (TTC)

This report was prepared for the Transportation Information Steering Committee by Malatest. Malatest recognizes and appreciates all the support and cooperation from the TISC committee throughout the project.

1. OVERVIEW

The Transportation Tomorrow Survey (TTS) is a confidential and voluntary travel survey on how Ontarians in the Greater Golden Horseshoe and surrounding areas (GGHA) use the transportation system. The data collected helps local and regional governments, as well as the province and transit agencies, make transportation planning and investment decisions. The 2022 TTS is one of the largest and most comprehensive travel surveys in North America, and the eighth in a series of surveys conducted every five years since 1986.

1.1. Background

The TTS methodology has remained similar from 1986 to 2006. The survey sample was drawn from telephone subscriber directories, with advance letters sent to inform households about the survey, and surveys conducted via telephone interview. In 2011, online surveying was introduced to supplement the telephone interviewing, with 12% of participating households completing the survey online. In 2016, the survey sample was drawn from a database of mailable addresses, which was matched, where possible, to telephone numbers listed in the telephone subscriber directory. Addresses not matched to a telephone number received a survey letter inviting them to participate online or via phone while addresses matched to a telephone number received both a letter and telephone calls. In 2016, 36% of participating household completed the survey via telephone interview and 64% completed the survey online. This methodology was continued in 2022, with a notable shift towards a preference for completing the survey online, with 12% of participating households completing the survey via telephone interview and 88% completing the survey online.

The data weighting approach also remained similar from 1986 to 2006. The data were weighted with expansion factors such that the expanded survey data represented Statistics Canada Census counts of private dwellings occupied by usual residents. In 2011, the data were weighted such that the expanded survey data represented total population counts by age group (which included persons living in both private and collective dwellings). In 2016 and 2022, the data were weighted such that the expanded survey data were representative of counts of private dwellings occupied by usual residents (with further adjustments to better represent all households by dwelling type, household size and to better represent household members by gender and age groups, and by employment status).

1.2. Area of Coverage

The initial TTS cycles in 1986 and 1991 were initiated by government agencies in the GTHA and the area of coverage reflected that initiative. However, because of the growing urban transportation interaction between the GTHA and the surrounding areas, other surrounding communities were invited to participate in later surveys.

1.3. Survey Magnitude

For the past two cycles (2022 and 2016), a random sample of households in the survey area was provided by Canada Post from a database of mailable residential addresses. In all previous surveys from 1986 to 2011, the random sample of households in the survey area was provided by a telephone subscriber listing service.

In 2022, the size of the sample targets was determined as required to obtain a 5% sample of occupied dwelling units in all areas except the City of Kawartha Lake, for which a 2.5% sample of occupied dwelling units was targeted. In 1991, a smaller sample was obtained in developed urban areas. Otherwise, the size of the sample was determined as required to obtain a 5% sample of the occupied dwelling units, with some variation in the sampling rates by municipality in different survey cycles. The 2022 TTS achieved a slightly lower average sampling rate of 4.3%

overall (while more households were surveyed, this is the sampling rate after filtering out surveys with missing or poor trip data).

Table 2 Survey records and expanded totals by year, 1986-2022

RECORDS AND ESTIMATES FOR TTS						
Cycle	Households		Persons		Trips	
	Records	Expanded total	Records	Expanded total	Records	Expanded total
2022 TTS	158,662	3,673,865	366,172	9,550,539	759,736 2016-equivalent: 683,975*	19,470,493 2016-equivalent: 17,183,861*
2016 TTS	162,708	3,335,990	395,885	8,822,802	798,093	17,522,728
2011 TTS	159,200	3,117,500	410,400	8,520,300	858,800	17,924,300
2006 TTS	149,600	2,871,200	401,700	7,705,300	864,300	16,541,700
2001 TTS	136,400	2,417,500	374,200	6,529,600	817,700	14,200,600
1996 TTS	115,200	2,317,200	312,800	6,285,100	658,000	13,185,500
1991 TTS	24,500	1,709,600	72,500	4,729,200	157,400	10,231,100
1986 TTS	61,400	1,466,100	171,100	4,063,000	370,200	8,761,000

* 2016-equivalent: trips made by persons 11+ years, excluding non-commute walking trips, which fit the definition of trips captured in 2016 and earlier survey cycles.

1.4. Survey Content

All TTS are retrospective surveys of travel taken by every member (age 11 + from 1986-2016; age 5+ in 2022) of the household during the day previous to the telephone (or web) contact. Until 2011, all information was collected by an experienced interviewer over the telephone. In 2011 and 2016, the household was given the option of a telephone interview or completing the interview through an online survey.

The information collected and the method of collection has remained relatively consistent since the first cycle. However, several key changes in 2022 should be considered when comparing data across previous cycles. These include:

- Trip capture from those 5+ years of age, compared to the 2016 TTS and earlier, for which trips were captured from those aged 11+ years;
- Inclusion of walking trips with a trip purpose (while continuing to exclude recreational walk trips), whereas in 2016 TTS and earlier, walking trips were only captured if they were commutes to work or school or essential links between other trips by non-walk modes;
- Addition of a gender diverse category;
- Expanded occupation types (from 4 categories to 12);
- Expanded household income ranges (from 4 to 10);
- Expanded trip purpose categories (from 8 to 17);
- Capture weekday travel pattern to work; and,
- Addition of new equity questions (i.e., immigration status, ethnic origin).

Before each survey, the questions asked were reviewed and some additions made, which reflect the changing interests of the participating agencies.

1.5. Report Content

This report is divided into three sections, based on geographic areas, presenting origin-destination matrices from the years 1986, 1996, 2001, 2006, 2011, 2016 and 2022 (with 2022 provided for the full dataset, and for 2016-equivalent trips).

The first section presents trip matrices for the municipalities in the entire TTS area. It is based on trips made by households in the TTS area which originated and were destined to the full TTS area, excluding trips made to and from areas external to the TTS area.

The second and third sections of this report present trip matrices only for the Greater Toronto and Hamilton Area (GTHA). These are presented at the regional level in the second section and the local municipality levels in the third section. The totals presented in these matrices are based on trips made by households in the GTHA which originated and were destined for areas in the GTHA. (i.e., the matrices for the GTHA exclude trips which were to or from areas external to the GTHA which were made by households within the GTHA, and also exclude all trips that were within the GTHA but made by households outside the GTHA.)

In each section, two kinds of origin-destination trip matrices are presented. Both include all travel modes and cover the 24-hour period as well as three-hour morning peak period (including all trips with start times between 6:00 a.m. through 8:59 a.m.). The first type is the origin-destination matrix which presents all trip purposes and includes all trip records in the database.

The second type is the home-to-work trip matrix which presents the first work trip for each person. The destination is the actual destination of the work trip, however, the trip origin, as recorded in the survey, is replaced by the home location of the commuter. The definition differs from the Place-of-Work (POW) information from Statistics Canada in that the Census data uses home-to-work linkages for workers who were or had recently been employed at the time of the survey and their reported 'usual' mode of travel, not actual trips recorded on a randomly sampled weekday.

Data from six of the eight surveys, 1986, 1996, 2006, 2011, 2016, and 2022 are presented in this report. The six surveys differ in survey area as shown in the participating jurisdictions table on page 4.

The trip matrices are presented separately for each survey year. Values have been rounded to the nearest one hundred.

Two versions of the 2022 results are presented:

- one has the 2022 results for the full trip dataset with all trips made by persons 5+ years of age, and including all walking trips (the new baseline with the new trip capture definitions); and
- one has the 2022 results filtered to just trips equivalent to those that would have been captured in 2016 and earlier surveys, with only trips made by persons 11+ years and only walking trips if they are for commute purposes (i.e., filtering out trips made by persons 5-10 years, and filtering out walking trips that are not commute trips or essential links in trips by other modes).

Note that the 2022 results for the first trip to work should be the same whether they are based on the full 2022 results or based on the 2022 results filtered equivalent to the 2016-and-earlier trip capture parameters. This is because there are no workers between the ages of five and ten, and all walk commute trips were captured in both the old and the new trip capture parameters.

1.6. Comparability of Survey Cycles

Caution should be undertaken when comparing data between survey cycles. The comparability of the datasets for individual cycles may be affected by a number of factors including: how well the target population (residents of private households) is represented by the sample source used in the given cycle; changes in survey methods; and how the survey sample was weighted and expanded to represent the total population.

From 1986 through 2001, the sample source of listed land-line telephone subscribers provided excellent coverage of all private residences in the survey area, the survey methods were the same, and it was possible to weight the data with simple expansion factors such that the weighted data matched household counts. While simple expansion factors might not take into account some household characteristics and population demographics that may be considered to be determinants of travel behavior, given that coverage of all households was good and response rates were high, the expanded data could be considered to be quite representative of the target population. Due to the consistency of the sample frame, survey methods, and data weighting, the data for these cycles can be considered quite comparable to each other.

In 2006, the survey methods and data weighting were also the same as in previous cycles, however, it may be noted that cell-phone-only households were beginning to represent an appreciable proportion of the population, with the proportion of households in Ontario with telephone land-lines having declined to 92.5%, and with younger households in particular being less likely to have land-lines. As the survey sample was based entirely on listed land-lines as in previous cycles, the exclusion of cell-phone only households may have had a very modest impact on the representativeness of the expanded survey data.

The 2011 survey cycle had a number of differences from previous cycles:

- By 2011, cell-phone-only households were very common, with the proportion of households with a traditional land-line being less than 71% and the proportion of younger households with land-lines having diminished considerably further. As the survey sample frame was still listed land-lines, the exclusion of cell-phone-only households had a more pronounced impact on the representativeness of the expanded survey data than in previous cycles, particularly in areas with higher concentrations of younger households and smaller households (e.g. downtown Toronto). Even after the application of data weighting adjustments, some remaining bias from the limitations of the sampling frame could have affected the representativeness of the survey results.
- In 2011, online surveying was introduced as a survey method, with approximately 12% of respondents completing online. It may be possible that online respondents may interpret the questionnaire differently than when guided by a survey interviewer, so there is the

possibility that the introduction of this new survey method may have had a modest impact on results.

- A new approach to data weighting was taken in 2011. Adjustments were made first to expand the number of households to represent total apartments and non-apartments in the geographies of the study area, followed by adjustments such that the expanded survey data represented the Census distributions of the total population by age group. The Census counts of total population by age group include people living in collective dwellings so the survey results for the 2011 cycle may slightly over-represent the survey's target population (people living in private dwellings) and thus may slightly over-represent the number of trips made. The weighted household counts in 2011 deviated somewhat from the total private households in each study area per the Census.

The 2016 cycle also had a number of differences from previous cycles:

- In 2016, an address-based sample frame was adopted in order to obtain coverage of all households, not just those with directory-listed telephone land-lines. A portion of the random address sample was matched to listed phone numbers and received high response in both telephone and online surveying. However, the 'address-only' portion of the sample, which received only a survey invitation letter, had lower response. While it was necessary to use address-only sample to achieve coverage of cell-phone-only households, there is likely higher non-response bias in this portion of the sample, although this is compensated for in part by data weighting.
- In 2016, the proportion of all surveys completed online increased considerably, to 64% of all survey completions. If online respondents filled out the questionnaire differently than respondents surveyed by telephone interview, this could have an impact on results.
- A more complex approach to data weighting was taken in 2016: an iterative proportional fitting method was undertaken to adjust the household weights according to the following controls: dwelling type, household size, and householder age by gender. As the method employed made household-level adjustments based on the age/gender demographics of all householders, the 2016 expanded household counts in the survey data match the Census household counts (rather than matching population as in 2011). It may also be noted that the 2016 survey data take into account household size, whereas previous surveys may have had more variance from Census household size distributions. If travel patterns differ for people in households of different sizes, this may have an impact on the survey estimates.
- Of note, the 2016 survey obtained 2.3% more survey completions than were obtained in 2011, but gathered 3.5% fewer person records (see Section 1.3 of this report). This may be due, in part, to the ongoing trend of diminishing household sizes and, in part, to better coverage of one-person households in the 2016 survey (the 2011 survey under-represented one-person households and over-represented two- and three-person households).

The 2022 cycle carried on with the survey methods and data weighting introduced in 2016, but also had some notable differences:

- Response rates were lower than in previous cycles. Telephone response rates for the address-and-phone portion of the sample were significantly lower than in previous cycles. Online response rates were also lower for both the address-and-phone and address-only portions of the sample. The lower response rates could be related in part to an increase in call-screening technologies and the public's diminishing willingness to engage in telephone surveys in part to the lingering impacts of COVID-19 on civic engagement. The lower response rates may mean that there could be a somewhat higher non-response bias in the raw unweighted survey sample than in previous survey cycles. The data weighting by household and demographic characteristics was intended to correct for bias.
- The 2022 questionnaire included additional questions and expanded the number of response options for a certain questions (see Section 1.4). In addition, the expansion of trip capture to persons 5-10 years of age and the capture of all walking trips may also have added to the survey length and the burden of response. Abandonment rates were slightly higher than in 2016, but not enough to explain the lower response rates observed.
- In 2022, the proportion of all surveys completed online increased again, to 90% of all survey completions. If online respondents interpreted the questionnaire differently than respondents surveyed by telephone interview, this could have an impact on results.
- In 2022, only 2.5% of surveys that completed to the end of the trip section were rejected. This compares to 5% in 2016 and 5% in 2011. This may be due to improvements to the online survey (additional prompts and improved map interaction), additional tests, and increased efforts to troubleshoot surveys with poor information, including better tools for validating and correcting transit information.
- In the data weighting for the 2022 survey cycle, Statistics Canada Labour Force Survey (LFS) data by Census Metropolitan Area (CMA) or Economic Region (ER) were introduced as an additional data weighting control, to ensure that the proportions of full-time employed, part-time employed, and unemployed persons in the labour force were closer to LFS proportions at the CMA or ER level. LFS-based adjustments were not possible for portions of the study area that did not align with complete geographies for which LFS data are available.

Further research to explore the impacts of changing sample frames, survey methods, and data weighting on the survey results would be required to determine the extent to which the differences in methodology may affect the survey results. Some caution may be exercised when comparing the results from different survey cycles, particularly for geographies or subpopulations with smaller sample sizes. However, the questionnaire design across all recent cycles has maintained the same core elements, and both the survey and data weighting methodology in 2022 were very similar to that in 2016, so trends and significant shifts in behaviour should be discernable from the results above the 'noise' associated with differences in survey methods.

2. ORIGIN-DESTINATION MATRICES: TTS STUDY AREA

Note: Only the portions of the counties of Wellington and Peterborough that were included in the TTS study area are represented on the map.

2.1. 2022 SURVEY DATA (NEW BASELINE: PERSONS 5+, INCLUDES ALL WALK TRIPS) – TTS STUDY AREA, 23 REGIONS
